

1pg-notes from CV19 mRNA Vaccines Were Meant to Kill People – Dr. Michael PalmerWell, the poison is the principle of sneaking the genes for the spike protein into our own body cells. Our own body cells then are instructed to convert the information on the gene into the actual spike protein. This spike protein produced by our cells appears on our cell surfaces and that is recognized by the immune system as a foreign antigen. The mRNA, it acts poisonous because it causes the formation of the spike protein. So it's the spike protein that actually gets recognized by the immune system. But the important point is it's not the very specific properties of this spike protein that causes the immune system to attack but simply the foreign nature of the spike protein. The fundamental function of the immune system, of the specific immune system is to discriminate between self antigens the body's own proteins which are to be left alone. Cells that produce the body's own proteins from the body's own nucleic acids they are to be left in peace.

But cells which happen to express proteins which don't belong to the body, which are foreign they should be attacked by the immune system and they should be destroyed. It's a very generic approach. The immune system fundamentally discriminates between self and non self proteins. And these mRNAs, in these mRNA vaccines they induce the synthesis of a non self protein. That is in the case of the COVID vaccines, the spike protein. But it's not important that it is a spike protein. It is only important that it's a foreign protein now. And that is an important message because the same must be expected to happen with any and all future mRNA vaccines. If they want to use an mRNA vaccine against a bacterial antigen. The problem will be the same. We will have the same sort of consequence.

The foreign proteins will be produced inside our body cells. They will be taken to the cell surface. The immune system will see them and will attack the cells that have produced these foreign antigens. So that is a generic, generic problem. And any mRNA that is taken up by our body cells and which causes these body cells to produce a foreign antigen will thereby cause the immune system to attack this cell and kill it off.

Why we should stop all mRNA vaccines. Because the entire technology is fundamentally flawed. It will always produce the outcome that the body will begin destroying itself. This was predictable. It was in fact, predicted. And we indeed see as the most common manifestation what's called vasculitis inflammation and destruction of the blood vessels This then also causes blood clots and so on. So if you have a focus of destruction at the inner surface of a blood vessel, then this whole set of blood clotting and then you get strokes and heart attacks and this sort of thing.

Do the mRNA vaccines clearly destroy the immune system, lower the capacity of the immune system? Yes, that's a fair assessment in various ways. One is simply that the bandwidth of the immune system, so to speak, is limited, right. The immune system. That's why you get these Turmo cancers. Because exactly, that's quite possible. So the immune system is kept busy with attacking their own body, the regular body cells, and it is then simply not paying attention anymore to cancer cells or it is also not as paying as much attention to other infections.
